

Configuring the Build Path for Java Projects that need JavaFX in Eclipse

Your Java Build Path for the project folder should look like this:

The JavaFX jdk can be found at Gluon's site: <https://gluonhq.com/products/javafx/>. Once you go there you should download this zip file and extract the contents to your device's operating system: openjfx-11.0.2_windows-x64_bin-sdk.zip.

Then add ALL the External jar files from the lib folder of the above zip file
